

What does your bot do?

The bot acts as an AI assistant that answers user questions using the Google Gemini API.

-

Feature 1

When the user says:

Any message that is not a command (e.g. "What is machine learning?", "Tell me a joke", "Help me write an email")

The bot should:

Send the user's message to Gemini and return Gemini's response.

Use this API endpoint:

Gemini Generate Content API

Show the user:

- Gemini's generated answer
- Any relevant explanations or examples
- Follow-up suggestions if provided by Gemini

-

Feature 2

When the user says:

/start

The bot should:

Introduce itself and explain how to use the bot.

Use this API endpoint:

No API call required

Show the user:

- Welcome message
- Description of bot capabilities
- Example questions to ask

===

IMPORTANT:

When generating the Telegram bot code, only allow the following Gemini models to be used. Do not use any other model names.

Allowed models:

models/gemini-2.5-flash

models/gemini-2.5-pro

models/gemini-2.5-flash-lite

models/gemini-2.0-flash

models/gemini-2.0-flash-lite

models/gemini-3-flash-preview

===

Google Colab Requirements

IMPORTANT:

This code will run inside Google Colab.

The Gemini API key is already stored in Google Colab Secrets under the secret name:

GOOGLE_API_KEY

===

Create a Telegram bot based on the requirements above. Use the API endpoints provided for each feature and generate all code needed to run the bot.
